

QUIZ 9 - ICS 415 Fall 2017

Imagine an API written in PHP.

1. Complete the API so when function = 'add' then it will return the sum in result. Otherwise it will return 'unknown function'.

```
<?
    $function = $_REQUEST['function'];
    $operand1 = $_REQUEST['operand1'];
    $operand2 = $_REQUEST['operand2'];
    $result='';

    if($function == 'add')
    {

    }

    else
    {
        $message = '          ';
    }

    $ret = json_encode([
        "function" => $function,
        "message" => $message,
        "result" => $result
    ], JSON_PRETTY_PRINT);

    echo $ret;
?>
```

2. What URL would be used to add 5 and 3?

3. Exactly what would be returned in (2)?
